

Green Philosophy

The building has been renovated and designed to reduce the environmental impact, waste of energy and CO2 emissions: reason why it has been assigned to the Hotel the class A of the Energy Classification according to European directive 2002/91/EC.

Hotel Porta Felice is equipped with solar thermal plant for the production of domestic hot water intended for the use of the rooms and the spa. We reduce the consumption of gas produced by the boiler with its CO2 emissions.

We prefer not to waste anything, so we chose the supplies for the drinks which are returnable. Statistics show that the use of returnable glass reduce the impact of waste produced by 96% and produces energy savings of 76%.

Each tap is equipped with flow reducer: a special system fragmenting the water into tiny particles and mix it with air. The volume of the jet remains full-bodied and comfortable but consumption is reduced by about 50%.

Hotel Porta Felice adopts environmental protocols for the linen and the courtesy kit. With the change of linen on request (when you want towels are replenished just leave them on the ground) decreased by 30% wastage. The additional set of toiletries is provided only when the customer wishes: so we will limit the production of plastic waste.

These are small actions which help Hotel Porta Felice and its guests to take care of the environment.
